The Model Y gap Page 4

The agents outgrew git

Merged code rose from about 2,500 changes a day in May to over 30,000 in September; a team of seven built a new system.

QUOTE OF THE WEEK

"In May, we merged around 2,500 code changes per day. In September, we merged more than 30,000 per day."

@AnthropicAI · page 4

PRINTING THIS ISSUE

A4, double-sided, flip on long edge. To saddle-stitch, print as a booklet on four A3 sheets, flip on short edge, fold and staple twice.

The world this week

POLITICS FROM THE BOOKMARKS

OpenAI (@OpenAINewsroom) said its models helped trace a hidden office recording device to an employee; it referred the matter to the FBI, whose agents moved quickly to make an arrest. @OpenAINewsroom

Electric cars were about 6.5 per cent of US third-quarter new-car sales, up 7.7 per cent on the second, the first significant growth in a year, @SawyerMerritt wrote, citing Cox Automotive. @SawyerMerritt

Meta trained its new Muse Wonder models at its gigawatt-scale Prometheus data centre, @amitisinvesting wrote in a market recap, adding that Meta calls them its most capable AI models yet. @amitisinvesting

Anthropic (@AnthropicAI) merged more than 30,000 code changes a day in September, up from around 2,500 in May, and said the jump led it to build an in-house version-control system, Scion. @AnthropicAI

OpenAI says it currently has no indications that the employee improperly accessed or exfiltrated model weights, source code or customer data, @kimmonismus wrote, relaying the company's statement while the FBI investigation continues. @kimmonismus

Ten-year Treasury yields fell despite a "horrible print" for CPI. @amitisinvesting wrote that his own theory, which he is not sure of, ties the drop to falling chip stocks and corporate capex debt. @amitisinvesting

THE WEEKEND BOOKMARK

Never miss a Saturday.

The week's best bookmarks, edited down to sixteen pages and delivered as a print-ready PDF every Saturday morning.

bkmk.to/subscribe

BUSINESS FROM THE BOOKMARKS

SpaceX Super Intelligence (@SpaceXSI) said it has unified plans across Grok, Cursor and X Premium into a single offer called The X Subscription. It gave no prices or other terms. @SpaceXSI

Gemini 4 Argon is rolling out globally in the Gemini API. Logan Kilpatrick (@OfficialLoganK) wrote that over 100,000 people at Google tested it in the past month, capping a six-month build. @OfficialLoganK

Gavin Baker (@GavinSBaker) wrote, in an opinion thread, that open-weight tokens will likely be the overwhelming majority, but the dominant frontier labs should still do well as thinner model margins lift compute demand. @GavinSBaker

Fish Audio (@FishAudio) wrote that it has raised a $52m seed round and has more than 15m users, as it launched Drama 3, an open-weight text-to-speech model it calls the most emotive and controllable. @FishAudio

@poteto wrote that agents copy what already exists, so a comment explaining a workaround spreads "like a weed". The advice: delete most code comments, sparing those that explain a browser quirk. @poteto

Anthropic may release Fable 5.5 this week, @kimmonismus wrote, relaying another account's unconfirmed report that it is "slated for this week", barring late hold-ups. No statement from Anthropic is cited. @kimmonismus

THE WEEKEND BOOKMARK

Pass it on.

Know someone who would like a quieter Saturday? Forward this PDF; it prints cleanly on any home printer.

Forward the file or print a spare copy

Booklet mode folds it into a small magazine

SECURITY

Show how the model identified the employee

OPENAI SAYS ITS MODELS IDENTIFIED AN EMPLOYEE WHO PLANTED A HIDDEN RECORDING DEVICE.

PROMPTED BY @OpenAINewsroom

OpenAI said it used its models to identify an employee who planted a hidden recording device; the employee was terminated and an arrest followed.[1] It said the models were used "to understand the device and where it had come from", and that the employee had planted it a few days earlier.[1] Its post gives the outcome but not the method.[1] The company said it referred the matter to the FBI, whose investigation is still ongoing, and thanked prosecutors.[1] It also said it has no indications that the individual inappropriately accessed or exfiltrated model weights, source code or customer data.[1] When a company uses AI to identify a suspect, it owes the public an account: what data the models examined, who checked their conclusion and what would have caught a wrong answer. A verdict without a method is an assertion. ■

CODE

Workaround comments are instructions

TO A CODING AGENT, A COMMENT EXPLAINING A TEMPORARY WORKAROUND LOOKS LESS LIKE A WARNING THAN A PATTERN WORTH COPYING.

PROMPTED BY @potato

Agents love copying what already exists, wrote lauren (@potato), who called a comment explaining a temporary workaround among the worst viruses in a codebase.[1] Like a weed, such a comment spreads as a tool for agents to get their job done, wrote @potato, until the codebase is "overrun with hacks and stale comments."[1] We agree: to an agent, such a comment reads as an instruction. Exceptions are narrow: @potato said the /no-comments skill in gstack seeks out useless comments while keeping the ones that actually should exist, such as one explaining a browser quirk.[1] Fix the workaround or delete it; a note promising later repair teaches the machine to repeat it. ■

FRONTIER MODELS

Let the models compete

A CRUSH OF FRONTIER LAUNCHES, WITH AN UNCONFIRMED ANTHROPIC RELEASE REPORTEDLY NEXT, HANDS BUYERS LEVERAGE; THEY SHOULD KEEP IT BY STAYING MODEL-AGNOSTIC.

PROMPTED BY @finkd

Logan Kilpatrick
@OfficialLoganK

POST

Today we are rolling out Gemini 4 Argon globally in the Gemini API, to Pro + Ultra in Gemini App, and Ultra subs in Antigravity! Argon is a huge step forward for Gemini, and a labor of love. This model has been battle tested by over 100,000 people at Google over the last month, with so much raw innovation, ambition, and hard work baked into this release. The team has been heads down over the last 6 months working to make this possible across the stack (research, infra, safety, eng, etc). We rolled the model out to cyber defenders as part of our fairwind program and early access customers over the last 2 weeks, it has been amazing to see and talk to folks who are now using this model daily. Seeing the models writing capability, raw knowledge and...

11 OCT 2026 bkmk.to/3t1

POST BY @OFFICIALLOGANK

The week brought a pile-up of frontier models. Mark Zuckerberg (@finkd) introduced Muse Wonder, which he called "our new family of frontier models with state of the art performance for personal and professional agentic work".[1] A day later Logan Kilpatrick (@OfficialLoganK) wrote that Gemini 4 Argon was rolling out in the Gemini API, having been "battle tested by over 100,000 people at Google over the last month".[2] He added that the model had been rolled out to cyber defenders and early access customers before launch, and that it offers 1M token output when the model needs to work more.[2] Mr Kilpatrick also called Argon "a huge step forward for Gemini".[2]

Anthropic may be next.[3] @kimmonismus wrote that Fable 5.5 is "very, very close - probably arriving this week", quoting another account's post and adding that he is told it is "slated for this week".[3] Treat that as unconfirmed. The claim is second-hand, and nothing from Anthropic appears in the material before us. @kimmonismus also wrote that OpenAI intends to ship 6.1 Astra this month.[3] The account wrote that everyone can feel the pace accelerating with Meta Muse, Gemini 4 and GPT-6-Astra.[3]

We think the crowding is good news for anyone who buys models rather than builds them. Gavin Baker (@GavinSBaker) wrote that the most likely outcome is "a hybrid, multi-model future where almost everyone wins", with infrastructure and applications benefiting from "increased fragmentation, competition and lower margins at the model layer".[4] He added that lower margins at the model layer "mechanically drive higher compute demand as long as someone is willing to pay for the training".[4] Thin margins for labs are another way of saying better terms for customers. Rivals that keep leapfrogging each other have every reason to compete on price and service.

The sensible response is to stay model-agnostic. Mr Kilpatrick wrote that Google's "iteration speed with Gemini is fast", pointing to a run of versions from 3.5 to 3.8 Flash.[2] The account behind the Fable report already had a farewell ready: "Enjoy your brief time in the limelight little Argon".[3] When this week's leader can be next week's also-ran, betting the firm on any lab is a wager on its roadmap, not a strategy.

In practice that means keeping prompts, evaluations and data portable, routing each task to whichever model handles it best, and signing nothing that makes switching painful. Mr Baker wrote that nobody should "trust any 5-20 individuals" to set the direction of this technology.[4] He also wrote that he wants "as many AIs as possible" to encompass the diversity of human values.[4] Buyers should not hand any lab their whole stack either. Let the models compete; the customer collects the winnings. ■
